Viewing the input sentence (or program) as a parse tree, attribute grammars can pass values from a node to its parent, using a synthesized attribute, or from the current node to a child, using an inherited

attribute.

grammars (BNF). Used to solve some typical problems: n Type checking and type inference n Compatibility between procedure definition and call. Associate attributes with terminals and nonterminals. Associate

semantic functions with productions. n Used to compute attribute values.

A context-free

grammarconsists of a number of productions. Each production has an abstract symbol called a nonterminalas its left-hand side, and a sequence of one or more nonterminal and terminalsymbols as its right-

hand side. For each grammar, the terminal symbols are drawn from a specified alphabet.

This chapter describes the

context-free grammars used in this specification to define the lexical and syntactic structure of a program. 2.1. Context-Free Grammars. A context-free grammar consists of a number of productions. Each

production has an abstract symbol called a nonterminal as its left-hand side, and a sequence of one or more nonterminal and terminal symbols as its right-hand side.

Context Free Grammar & Context Free Language - YouTube

Context free grammars (CFGs) are used to describe context-

free languages. A context-free grammar is a set of recursive rules used to generate patterns of strings. A context-free grammar can describe all regular languages and more, but they cannot describe all

possible languages.

however, is also regular. S ? a S ? aS S ? bS. The terminals here are a and b, while the only nonterminal is S.The language described is all nonempty strings of s and s that end in .. This grammar is regular: no rule
