This engaging guide demonstrates how easy, fun, and rewarding it can be to teach and learn coding at the library. • Helps librarians—even those without prior experience and training—launch highly successful programs in computer coding that engage both traditional literacy and technology literacy • Builds on the library's role as technology hub in the school and/or community • Enables librarians to cultivate practical and valued skills among students and patrons—all while they have fun learning • Offers insight from an instructor who leads coding clubs and classes in multiple libraries

The advent of powerful processing technologies and the advances in software development tools have drastically changed the approach and implementation of computational research in fundamental properties of living systems through simulating and synthesizing biological entities and processes in artificial media. Nowadays realistic physical and physiological simulation of natural and would-be creatures, worlds and societies becomes a low-cost task for ordinary home computers. The progress in technology has dramatically reshaped the structure of the software, the execution of a code, and visualization fundamentals. This has led to the emergence of novel breeds of artificial life software models, including three-dimensional programmable simulation environment, distributed discrete events platforms and multi-agent systems. This second edition reflects the technological and research advancements, and presents the best examples of artificial life software models developed in the World and available for users.

The 2008 Physics Education Research Conference brought together researchers studying a wide variety of topics in physics education. The conference theme was " Physics Education Research with Diverse Student Populations ". Researchers specializing in diversity issues were invited to help establish a dialog and spur discussion about how the results from this work can inform the physics education research community. The organizers encouraged physics education researchers who are using research-based instructional materials with non-traditional students at either the pre-college level or the college level to share their experiences as instructors and researchers in these classes.

There is oneTeacher's Guide which corresponds with each Student Activities Book, and consists of two parts: Answers and InstructionalAids forTeachers, and Answer Sheets. The Answers and Instructional Aids for Teachers provides advice for how to optimize the effectiveness of the activities, as well as brief explanations and comments on each question in the student activities. The Answer Sheets may be duplicated and distributed to students as desired. Use of the Answer Sheets is particularly recommended for activities requiring a lot of graphing or drawing.
